Summary

Cybersecurity student with experience in vulnerability assessment and risk analysis. Proficient with Python for developing automated security tools, including practical application of Nmap for network scanning and OWASP ZAP for web application testing. Focused on threat identification and developing mitigation strategies. Seeking a role to apply and expand these skills in a professional cybersecurity environment.

Technical Skills

Programming Languages: Python, C++, SQL, JAVA , Javascript

Libraries & Tools: NumPy, Pandas, Git, Docker

Projects

Image steganography tool Sep 2024
Language *Python*

- Developed a multi-stage steganography tool in Python that first compresses messages using a custom Huffman coding implementation.
- The data is then secured by applying a spread spectrum technique to make it resemble random noise, enhancing security.
- The secured binary is embedded into the image's Least Significant Bits (LSB) using NumPy and Pillow for efficient data concealment

Automated Vulnerability Scanning & Risk Assessment Engine Feb 2025
Vulnerability Assessment *Python, Flask, Nmap, OWASP ZAP*

- I built a Flask security dashboard to automate and orchestrate vulnerability scans by integrating Nmap for infrastructure and OWASP ZAP for web analysis.
- A custom risk engine processes the findings, calculating a weighted score from CVSS, EPSS, and threat intelligence to prioritize remediation efforts.
- The system automatically parses scanner XML reports and stores the final, actionable intelligence in a database for historical review.
